Topics to cover

- **PSA persistence/recurrence**
 - **Definitions and clinical implications**
- **Imaging**
- **Management**
 - **Salvage radiotherapy**
 - **Salvage lymphadenectomy**

AUA and NCCNs Definition of BCR

- **AUA:** Remission after prostatectomy is defined as nadir PSA < 0.2 ng/ml
- **NCCN:** PSA persistence/recurrence after RP is defined as failure of PSA to fall to undetectable levels (PSA persistence) or undetectable PSA after RP with a subsequent detectable PSA that increases on 2 or more determinations (PSA recurrence).

PSA Persistence after RP

- **Between 5 and 20% of men continue to have persistent PSA after RP (defined in the majority of studies as detectable post-RP PSA of > 0.1 ng/mL within four to eight weeks of surgery).**
- **It may result from persistent local disease, pre-existing metastases or residual benign prostate tissue.**
 - **In my experience > 0.1 ng/mL is not residual benign disease**
- **First steps are to repeat it for validation and follow at (2-3 month intervals) to get an initial read on the etiology.**

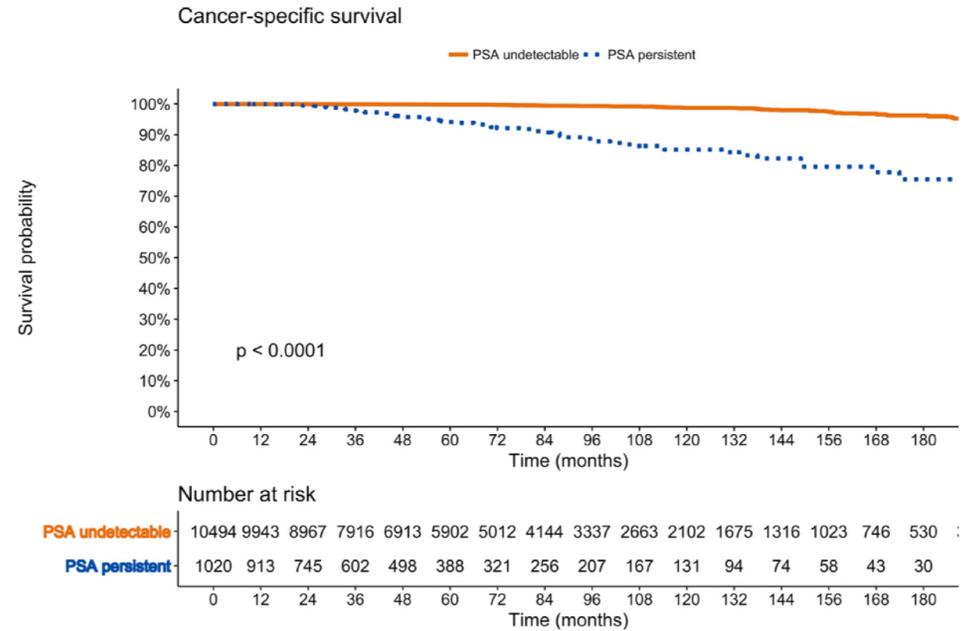

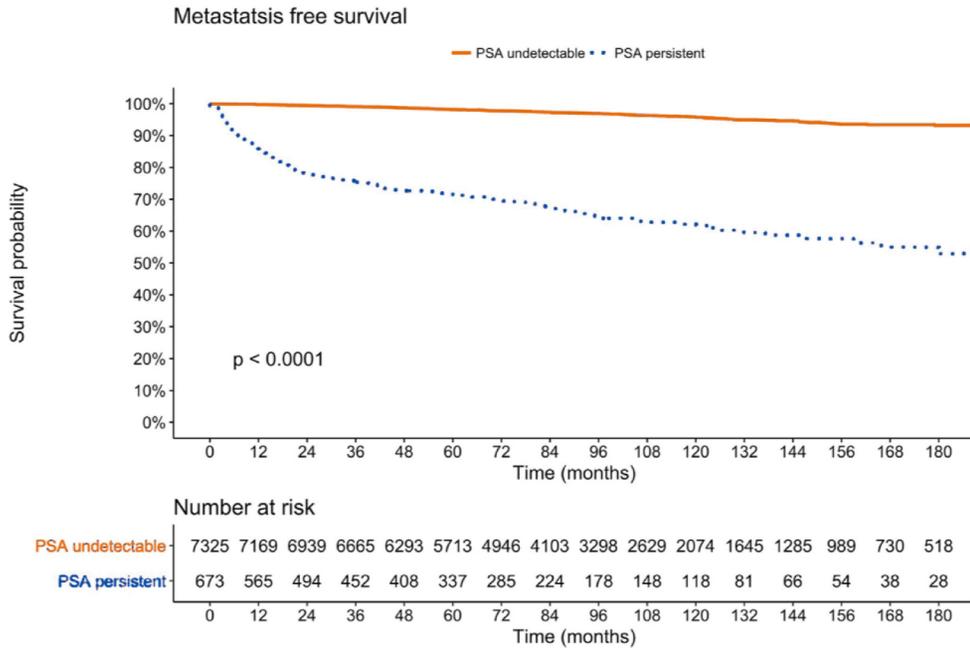

Prostate Cancer

Persistent Prostate-Specific Antigen After Radical Prostatectomy and Its Impact on Oncologic Outcomes

Felix Preisser^{a,b}, Felix K.H. Chun^b, Raisa S. Pompe^c, Alexander Heinze^a, Georg Salomon^a, Markus Graefen^a, Hartwig Huland^a, Derya Tilki^{a,c,}*

- **Of 11,604 patients (RP 1992-2016), 8.8% (n=1,025) harbored persistent PSA (≥ 0.1 ng/ml)**

Eur Urol. 2019 Jul;76(1):106-114.

- **At 15-years after RP, MFS and CSS was 53.0 vs. 93.2% ($p < 0.001$) and 75.5 vs. 96.2% ($p < 0.001$) for persistent vs. undetectable PSA**

Eur Urol. 2019 Jul;76(1):106-114.

Prostate Cancer

Persistent Prostate-Specific Antigen After Radical Prostatectomy and Its Impact on Oncologic Outcomes

Felix Preisser^{a,b}, Felix K.H. Chun^b, Raisa S. Pompe^c, Alexander Heinze^a, Georg Salomon^a, Markus Graefen^a, Hartwig Huland^a, Derya Tilki^{a,c,*}

^aMartini-Klinik Prostate Cancer Center, University Hospital Hamburg-Eppendorf, Hamburg, Germany; ^bDepartment of Urology, University Hospital Frankfurt, Frankfurt am Main, Germany; ^cDepartment of Urology, University Hospital Hamburg-Eppendorf, Hamburg, Germany

In multivariable analyses, higher preoperative PSA, more advanced pathologic tumor stage, pathologic GG3–5, positive surgical margins, and pN1 were associated with an increased risk for persistent PSA (all p<0.01).

Eur Urol. 2019 Jul;76(1):106-114.

Table 2 – Multivariable logistic regression models predicting persistent PSA (≥0.1 ng/ml) at 6 wk after radical prostatectomy

	OR	95% CI	p value
Clinical model			
Year of surgery	1.04	1.02–1.05	<0.001
Age	0.99	0.99–1.01	0.8

Pathologic lymph node status N1	2.32	1.88–2.85	<0.001
Pathologic lymph node status Nx	1.04	0.84–1.28	0.7

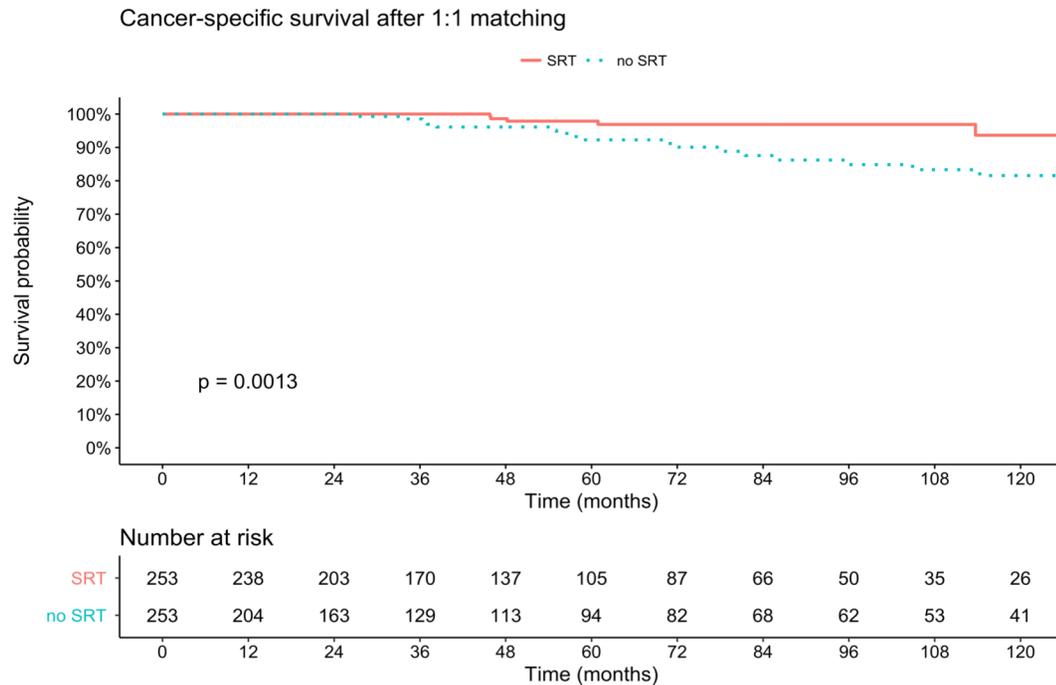

CI = confidence interval; GG = Gleason grade group; OR = odds ratio; PSA = prostate-specific antigen.

Prostate Cancer

Persistent Prostate-Specific Antigen After Radical Prostatectomy and Its Impact on Oncologic Outcomes

Effect of Salvage Radiation on Cancer-specific survival

- after Propensity Score Matching between patients with Salvage RT vs. no RT CSS at 10 years after RP was 93.7 vs. 81.6% in the **entire cohort** (p<0.01)

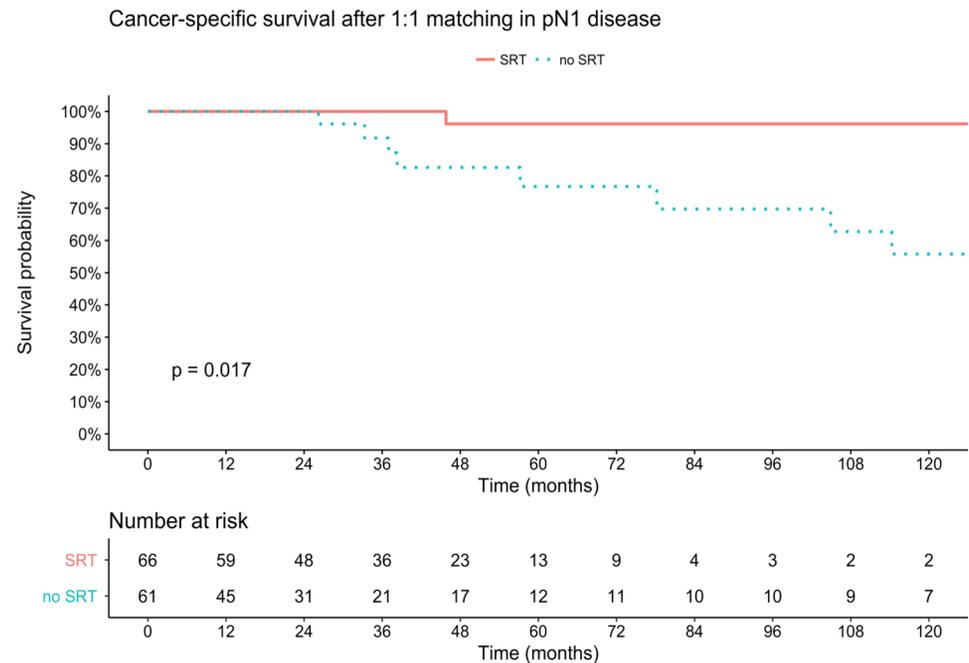

Eur Urol. 2019 Jul;76(1):106-114.

Prostate Cancer

Persistent Prostate-Specific Antigen After Radical Prostatectomy and Its Impact on Oncologic Outcomes

Effect of Salvage Radiation on Cancer-specific survival

- after Propensity Score Matching between patients with Salvage RT vs. no RT CSS at 10 years after RP was 96.2 vs. 55.8% in **pN1 disease** ($p < 0.01$)

Eur Urol. 2019 Jul;76(1):106-114.

Impact of Early Salvage Radiation Therapy in Patients with Persistently Elevated or Rising Prostate-specific Antigen After Radical Prostatectomy

Nicola Fossati^{a,}, R. Jeffrey Karnes^b, Michele Colicchia^b, Stephen A. Boorjian^b, Alberto Bossi^c, Thomas Seisen^c, Nadia Di Muzio^d, Cesare Cozzarini^d, Barbara Noris Chiorda^d, Claudio Fiorino^e, Giorgio Gandaglia^a, Paolo Dell'Oglio^a, Shahrokh F. Shariat^f, Gregor Goldner^g, Steven Joniau^h, Antonino Battaglia^h, Karin Haustermansⁱ, Gert De Meerleerⁱ, Valérie Fonteyne^j, Piet Ost^j, Hendrik Van Poppel^h, Thomas Wiegel^k, Francesco Montorsi^a, Alberto Briganti^a*

When patients were stratified into five risk groups using regression tree analysis (area under the curve: 85%), **early SRT administration provided better metastasis-free survival in three groups only:**

- (1) low risk: undetectable PSA after RP, Gleason score ≤ 7 , and tumour stage \geq pT3b,**
- (2) intermediate risk: undetectable PSA after RP with Gleason score ≥ 8 ,**
- (3) high risk: PSA persistence after RP with Gleason score ≤ 7 .**

Conversely, very low-risk (undetectable PSA after RP, Gleason score ≤ 7 , and tumour stage \leq pT3a and very high-risk patients (PSA persistence after RP, and Gleason score ≥ 8) did not benefit from early salvage treatment

Biochemical recurrence

- **Biochemical recurrence (BCR) continues to be reported in up to 35% of men undergoing RP**
- **The natural history of BCR after RP is variable and does not always translate into systemic progression or prostate cancer death**

DEFINING PROSTATE SPECIFIC ANTIGEN PROGRESSION AFTER RADICAL PROSTATECTOMY: WHAT IS THE MOST APPROPRIATE CUT POINT?

CHRISTOPHER L. AMLING, ERIK J. BERGSTRALH, MICHAEL L. BLUTE, JEFFREY M. SLEZAK
AND HORST ZINCKE

*From the Department of Urology, Naval Medical Center, San Diego, California, and Department of Urology and Section of Biostatistics,
Mayo Clinic, Rochester, Minnesota*

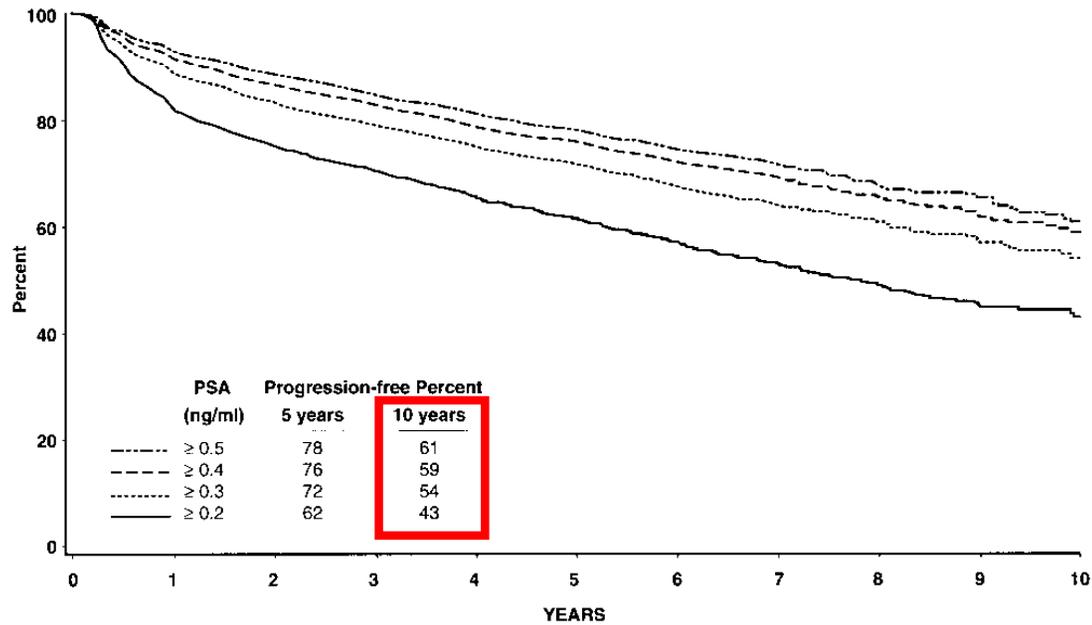

FIG. 1. Biochemical progression-free percent using different PSA cut points to define progression after radical prostatectomy. Number of patients at risk for progression at 5, 7 and 10 years ranged 1,354 to 1,728, 497 to 703 and 53 to 83, respectively.

Natural History of Progression After PSA Elevation Following Radical Prostatectomy

- **Retrospective review of 1997 men who underwent RP between 1982 and 1997**
- **Of the 1997 men, 315 (15%) developed biochemical PSA level elevation**
- **Eleven of these underwent early hormone therapy after the recurrence and are not included in the study**

Natural History of Progression After PSA Elevation Following Radical Prostatectomy

Figure 1. Actuarial Likelihood of Metastasis-Free Survival in 1997 Men Treated With Radical Prostatectomy

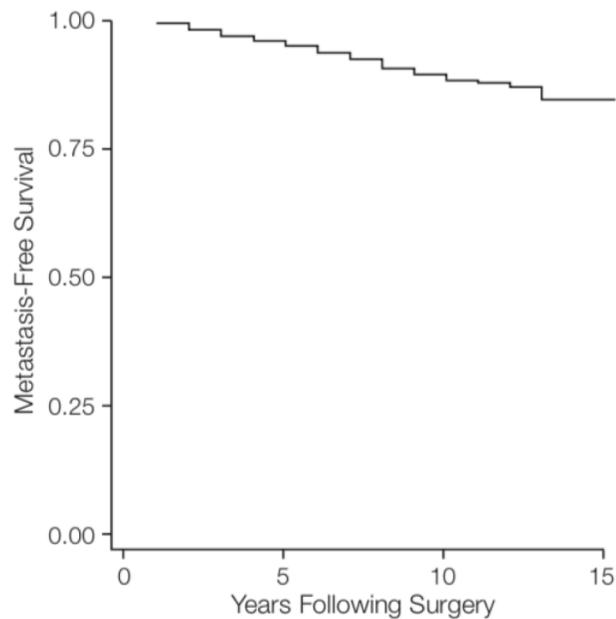

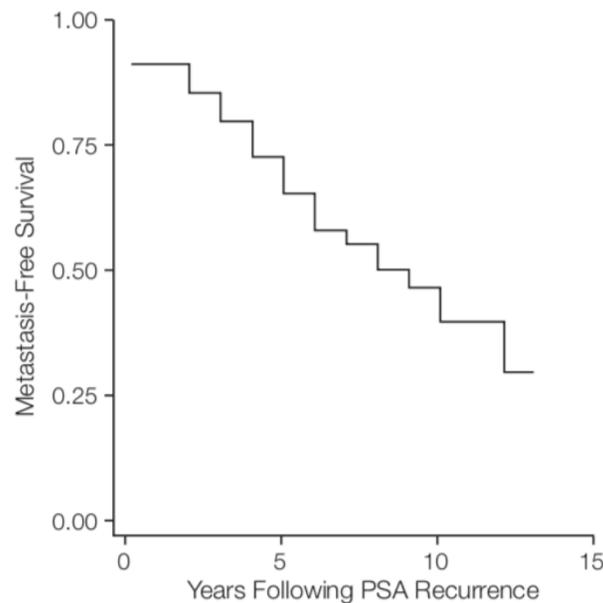

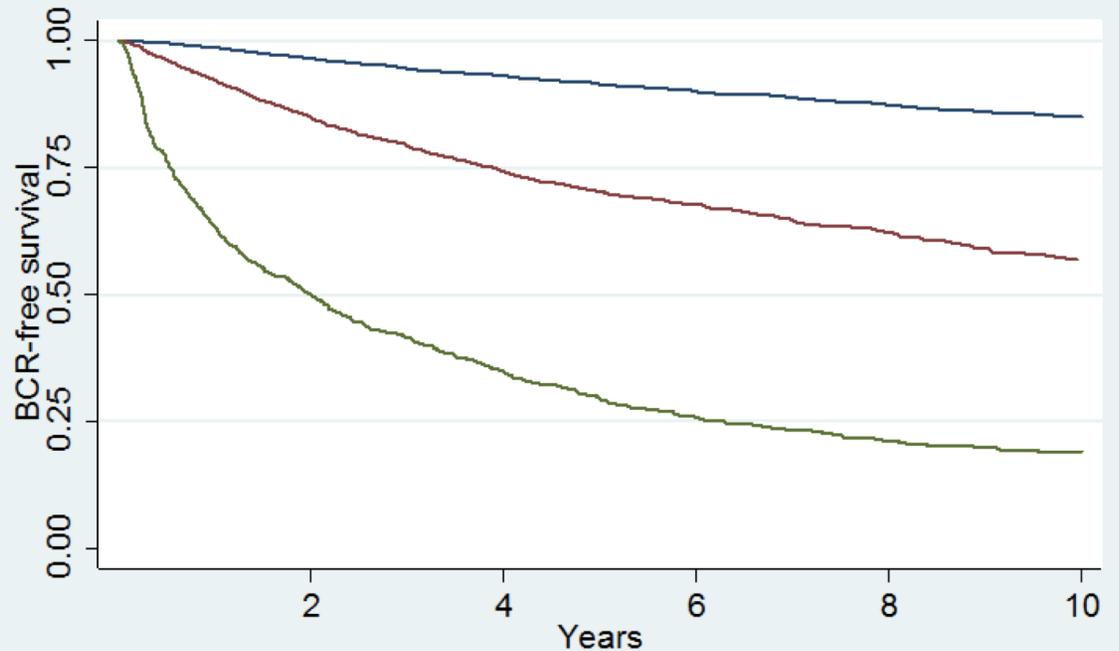

Figure 2. Actuarial Likelihood of Metastasis-Free Survival in 304 Men With Prostate-Specific Antigen (PSA) Elevation After Radical Prostatectomy

- **5-yr MP-free survival rate of 64% among 304 RP BCR patients who were observed until MP.**

Biochemical recurrence after Radical Prostatectomy

Number at risk						
7838	6407	4377	2827	1727	1044	
3890	2706	1656	972	576	365	
1752	573	298	169	100	76	

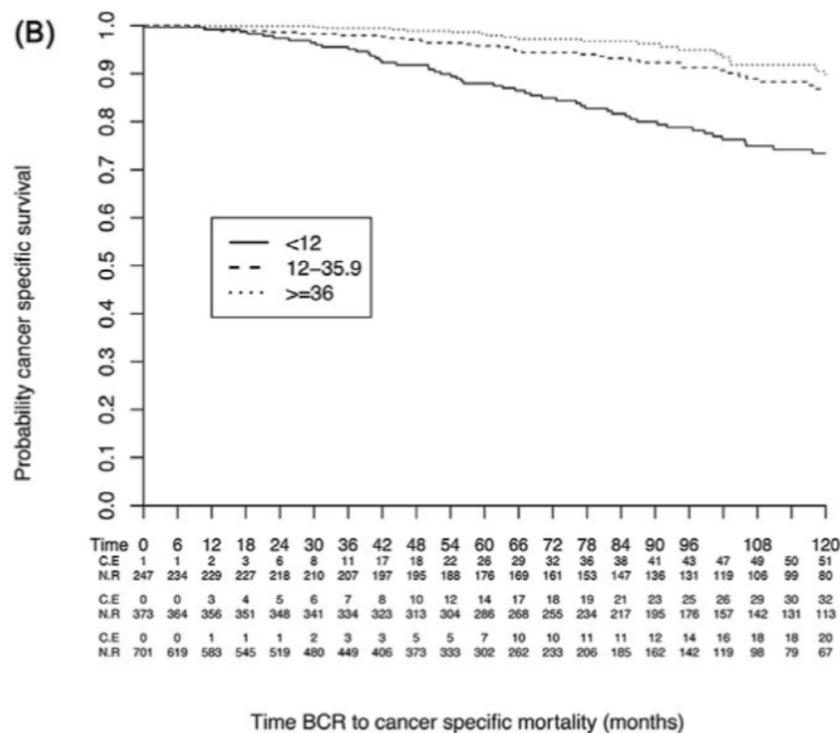

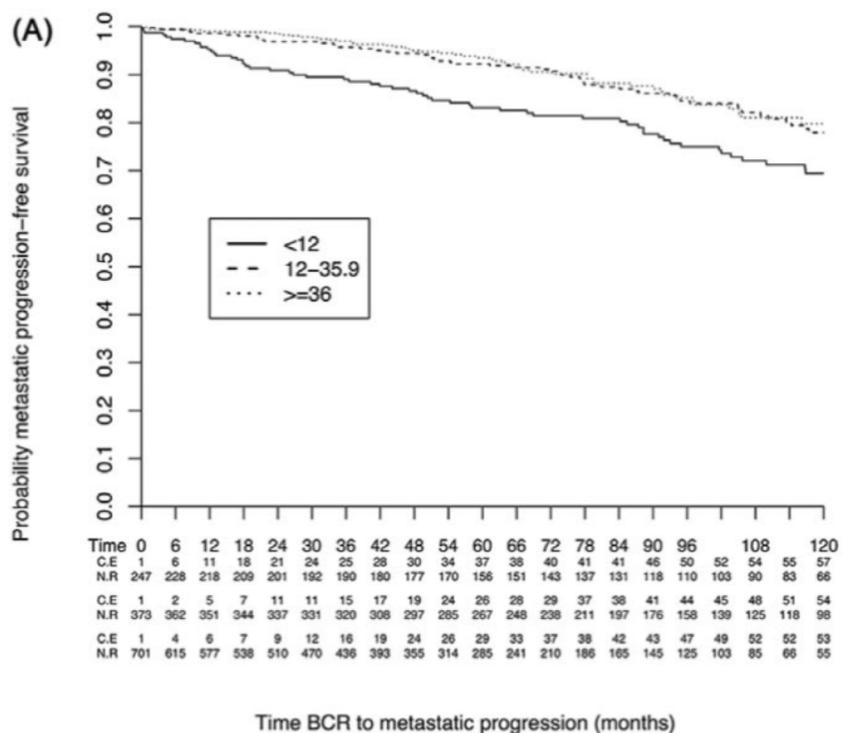

- **14,532 patients after RP (1992-2012)**
- **No neoadjuvant or adjuvant therapy**
- **Median follow-up: 50.8 months**
- **Biochemical recurrence occurred in 2950 (20.3%) men**

- Only approximately 30% of patients with BCR after primary surgery develop clinical recurrence, with only 16.4% dying from their disease
- Based on the review, proposal was to stratify patients into:
 - **EAU Low-Risk BCR:** PSA-DT > 1 year **AND** pGS<8 for RP
 - **EAU High-Risk BCR:** PSA-DT ≤ 1 year **OR** pGS8-10 for RP

External Validation of the European Association of Urology Biochemical Recurrence Risk Groups to Predict Metastasis and Mortality After Radical Prostatectomy in a European Cohort

Derya Tilki^{a,b,*}, Felix Preisser^a, Markus Graefen^a, Hartwig Huland^a, Raisa S. Pompe^{a,b}

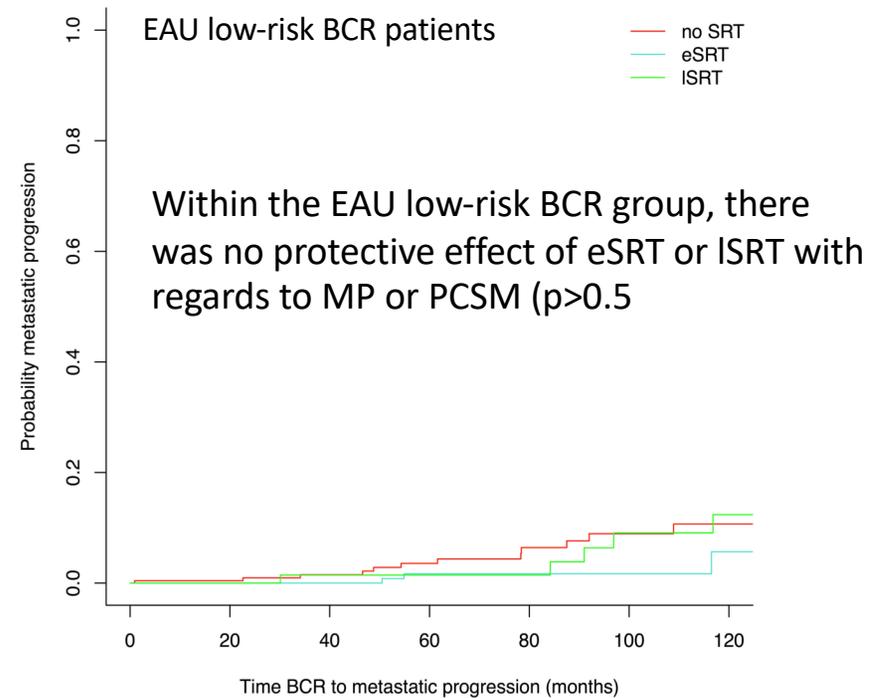

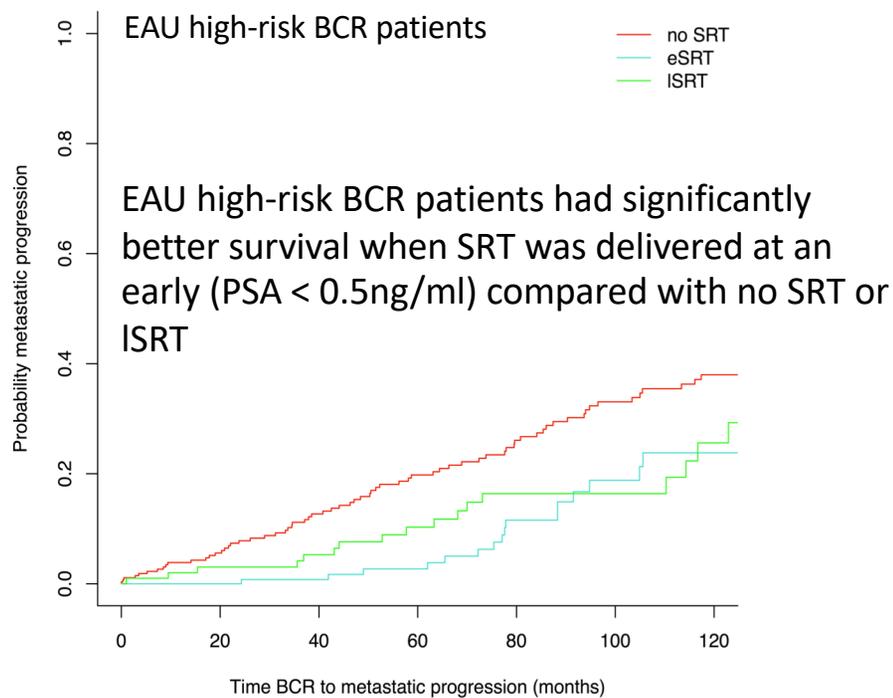

510 patients were considered EAU low-risk BCR; 530 patients met the EAU high-risk BCR criteria (RP between 1992 and 2006).

Prostate-specific antigen (PSA) recurrence after radical prostatectomy	LE	Strength rating
Perform prostate-specific membrane antigen (PSMA) positron emission tomography (PET) computed tomography (CT) if the PSA level is <u>> 0.2 ng/mL</u> and if the results will influence subsequent treatment decisions.	2b	Weak
In case PSMA PET/CT is not available, and the PSA level is ≥ 1 ng/mL, perform fluciclovine PET/CT or choline PET/CT imaging if the results will influence subsequent treatment decisions.		Weak
PSA recurrence after radiotherapy		
Perform prostate multiparametric magnetic resonance imaging to localise abnormal areas and guide biopsies in patients fit for local salvage therapy.	3	Strong
Perform PSMA PET/CT (if available) or fluciclovine PET/CT or choline PET/CT in <u>patients fit for curative salvage treatment.</u>	2b	Strong

on behalf of the EAU-YAU Prostate Cancer Working Group

- **Overall, 27 SLND series have been selected for synthesis.**
- **The 2- and 5-yr biochemical progression-free survival rates ranged from 23% to 64% and from 6% to 31%, respectively.**
- **Main drawbacks limiting the interpretation of the effectiveness of SLND were the retrospective design of single-center series, heterogeneity between series in terms of adjuvant treatment, endpoints, definitions of progression and study population, as well as the absence of long-term follow-up.**

Salvage Lymphadenectomy (sLND) series – PSMA-guided

Original Article	No. of patients	PSA	Imaging method	Mean No. removed LNs	Median follow-up (months)	Complete PSA response	PFS	CSS (%)

adapted from Ploussard et al., Eur Urol, 2018								

Conclusions

- **PSA persistence >0.1 has poorer prognosis but SRT beneficial**
- **PSA recurrence has several definitions**
 - **New EAU guidelines move from absolute value to risk groups**
- **Ultrasensitive PSA not specifically recommended in guidelines**
 - **>0.03 and rising correlates with BCR >0.2**
- **New imaging has a relevant and evolving role**
- **EAU low risk is at small risk of metastatic progression or cancer specific mortality**
- **SRT earlier and with ADT should be given in EAU high-risk**
- **Salvage surgical approaches are immature and should be considered cautiously**

Thank You
